FIELD INSPECTION REPORT  
AREA OF THE FOURTH RADIAL PLOT  
Project PH-2(45)

1. Description of the Area:

The area of the fourth radial plot is comprised of 3 shoreline surveys numbered 8860 to 8862 inclusive, and it includes that portion of the Franklin D. Roosevelt Lake meandering north and south between the mouth of the Spokane River to the south and the small settlements of Gifford and Inchelium to the north.

The topography of the terrain varies - rolling to mountainous. Sedimentary benches and pockets sustain a limited agricultural and pastoral economy.

On the west side of the Lake, the sedimentary benches or pockets that adjoin the lake front alternate with rugged mountain slopes which rise directly from the shore. A sedimentary bench extends from the mouth of Fall Creek northward beyond the limits of sheet 8862 and is composed mainly of sand or clay. It has been deeply incised by drainage action of former years. Shoreward erosion is proceeding rapidly along the entire face of this bench.

<sup>7-8861</sup>Between Fall Creek and Monaghan Creek, a slate ridge rises from the lakeshore. South of the latter Creek it strikes inland and terminates north of the mouth of Wilmont Creek. Fronting the Lake between these two latter Creeks is another sedimentary bench; it extends southward to Ninemile Creek with one interrupting slate ridge located about midway.

<sup>7-8860</sup>From Ninemile Creek to the south limits of sheet 8860, steep mountain slopes rise from 1000 to 1500 feet above the Lake.

Westward and inland of these areas, one finds rough and rugged mountain ridges that extend in a general north-south direction. They are covered with conifers and brush and the underlying structure is slate or other metamorphic rock.

<sup>7-8861</sup>South of Hunters (east side of the Lake) sedimentary benches front the major portion of the water area. The land is flat or rolling and occasionally, sharp peaks, for instance Miller Mountain or the butte SW of Fruitland, break up this pattern.

North of the town of Hunters, the benches give way to high ridges with a growth of pines and brush. Inland the topography is similar to that found across the Lake although less rugged.

In general, the drainage pattern for the whole area is well defined. A noticeable feature, by comparison with the areas in the first and second radial plots, is the marked increase in the perennial drainage. Intermittent streams frequently disappear into the ground on encountering the sandy benches that adjoin the Lake.

One major state highway (Washington #22) traverses the area north and south of the east side of the Lake. From Ninemile Creek northward, a gravel road parallels the west side of the Lake; a graded and drained road leads south from this Creek. Connecting gravel or dirt roads are found scattered through the area. A few minor access roads reach to the Lake north of Miller Mountain and west from Hunters. There are no railroads in the area.

The town of Hunters is a minor trading center; Fruitland and Cedonia are little more than crossroads. There are no towns in the area west of the Lake.

For additional information refer to the field inspection report for the area of the first radial plot under side heading 1, in the general description of the project area.

2. Completeness of Field Inspection:

The field inspection for the clarification of details on the photographs, and for the classification of roads, shoreline, buildings, et cetera, has been completed in accordance with the instructions for this Project dated 3 April 1947. For additional information see side heading 2 of the "Field Inspection Report, Area of the First Radial Plot".

3. Interpretation of the Photographs:

Heavy brush and slate formations, not previously encountered can be distinguished as follows: Brush - mottled tint; slate - by the linear appearance of the rock outcrops.

For additional information refer to the special report mentioned above.

4. Horizontal Control:

Refer to this side heading of the "Field Inspection Report, Area of the First Radial Plot".

5. Vertical Control:

Idem

6. Contours and Drainage:

Idem

7. Shoreline Plane of Reference:

Idem

8. Low-Water Line:

Idem

15. Bridges and Cable Crossings:

There were no bridges or submarine cable crossings (and overhead) across navigable waters found within the area.

16. Buildings and Structures:

A complete field investigation was made of any buildings or structures along the waterfront. Inland only those buildings and structures were identified that were visible from the water. Inland all public buildings were noted for which there was photograph coverage.

17. Boundary Monuments and Lines:

The original instructions relating to this phase of the work have been abrogated. Refer to the Acting Director's letter dated 7 November 1947, on the subject of the Lake Roosevelt reservation boundary.

18. Geographic Names: 814✓

Refer to this side heading of the "Field Inspection Report, Area of the First Radial Plot".

21. Field Photographs:

Idem

22. Symbols and Color Schemes:

Idem

23. CP Stations along the Reservoir Boundary:

It is suggested for the remainder of the project area, i.e., in radial plots 3, 4, 5, 6 and 7, that all the CP control stations along the reservoir boundary be plotted on the survey sheets by the compilation office to facilitate the future work of the hydrographic party - except for those stations actually found destroyed.

See Sub. 26  
Compilation Report

The reasons for this requested procedure are:

1. The original descriptions by the USER for these CP stations, as a general rule, are inadequate because of recent changes in the topography, relocated roads, et cetera.
2. In most cases where a station was searched for but not found, it is believed that if they are plotted on our shoreline survey sheets it may be possible that the hydrographic party could recover some of them if needed.
3. Until recently the shoreline inspection unit has made a thorough search for most of these stations if of value to hydrography or if needed to control the radial plots.

This practice, however, was modified to insure the completion

of work in this project this year. The shoreline inspection unit is recovering <sup>only</sup> at the present time those CP stations needed to control the radial plots and the occasional recovery of additional ones. On completion of shoreline inspection, and weather conditions permitting, a search will be made for the remaining stations by truck subject to accessibility, and if possible, some by boat.

4. Recent instructions specify that all hydrographic sites identified on the photographs must be substantial and definite, and that no instrumental ground work will be employed in establishing them. In view of these instructions, additional points will have to be located by the hydrographic unit. And these CP stations will have to be resorted to for some of their basic control.
5. To facilitate the recovery of those stations not searched for or found lost (mainly due to the inadequacy of the original description) by the hydrographic party, it is recommended that these stations be shown on the shoreline survey sheets by an appropriate symbol such as a "broken" triangle.
6. The plane coordinates of all CP stations will be listed, hereafter, on Form 709, and each station will be noted thus:  
  - r - recovered
  - nr - not recovered, i.e., not searched for
  - l - searched for but not found
  - d - found destroyed (not to be indicated on survey sheet)

COMPILATION REPORT  
Map Manuscripts T-8860 to T-8862 Inclusive  
Area of the 4th Radial Plot  
Project Ph-2(45)

26. Control:

Thirty<sup>one</sup> horizontal control stations were recovered and identified by the field parties for use in controlling the radial plot in the area of these three map manuscripts. Of this number, twenty-seven of the objects selected for sub-stations could be identified with certainty on a majority of the photographs; however, the other three sub-stations could only be seen on the photographs on which they were identified by the field party. The twenty-seven sub-stations, which could be identified with certainty, were sufficient to control the radial plot.

T-8860 = 11  
8861 = 10  
8862 = 10  
31

Because of insufficient end lap in line of flights, the use of the stereoscope was limited for transferring horizontal control stations and photo hydro signals from one photograph to another. This often made it impossible to obtain stereoscopic vision when viewing a stereoscopic pair. (See paragraph 2 of letter 711-rs, dated 23 September 1947, on the subject of photographs.)

All horizontal control stations, which were recovered by the field party, were plotted on the map manuscripts. In addition, at the request of the hydrographic party, all unrecovered USSR 3rd order stations lying along the shore of the lake, which were not found to be destroyed, were plotted. This was done in order to facilitate their recovery by the hydrographic party if they were needed. The original descriptions for this 3rd order control were written prior to the time that the lake was impounded, and were therefore inadequate. These unrecovered stations were indicated by a dashed line triangulation station symbol, and a note pertaining to same was lettered in the margin of the manuscript. (CP's series)

A complete tabulation of the horizontal control stations shown on these three map manuscripts is contained on several sheets of Form M-2388-12, which are attached to this descriptive report.

27. Radial Plot:

These three map manuscripts, Nos. T-8860 to T-8862 Inclusive, were combined into one radial plot known as Radial Plot No. 4, Project Ph-2 (45). This radial plot was completed in the same manner as Radial Plot No. 1 which has been fully described under Item 27 of the "Descriptive Report, Map Manuscripts T-8849 to T-8852 Inc., Area of the 1st Radial Plot, Project Ph-2(45)".

28. Detailing:

These maps were compiled in accordance with instructions for Project Ph-2(45). Features and symbols were shown as indicated in Photogrammetry Instructions No. 10, 12, and 17.

The transforming printer at the Washington Office was not in proper adjustment at the time the photographs were printed, and they could not be oriented in their entirety at the compilation table when radially plotting various types of pass points. Enough pass points, however, had been established during the radial plot so that each chamber of each photograph could be separately oriented. For at least two of the chambers on each photograph it was found necessary to de-center the photograph radially, to or from the chamber being oriented, so that the radials to the pass points and horizontal control stations in the chamber would pass through their positions on the map manuscript. Detailing was accomplished in the following manner:

1. All photo hydro signals, and shoreline pass points were radially plotted. Because of difficulties which have arisen on this and other projects, and in order to insure the accuracy of photo hydro signals, the located positions were then verified by a supervisor, and all questionable signals were rejected. (Shoreline pass points of two radial intersections are shown with green, waterproof ink circles on the reverse side of the map manuscripts.)

2. The shoreline was detailed from those photographs on which it was clearly visible and on which the bluffs were displaced outward from the center. (It might be stated that there were cases, particularly at the heads of narrow coves where displaced banks, cliffs and trees, and insufficient photograph coverage made it difficult to delineate the shoreline. In many of these places, stereoscopic vision could not be obtained. The shoreline in these areas was detailed after all photographs had been studied. It is, however, subject to minor changes by the hydrographic party.)

3. Pass points for use in detailing inshore planimetric features were located and the compilation of the sheet was completed.

4. A careful review was made of all radially plotted pass points and planimetric details.

Ozalid prints of the completed map manuscripts were furnished to the hydrographic party; however, it is recommended that they be used for reference purposes only. As many difficulties were encountered when transferring hydrographic signals and shoreline from distorted ozalid prints to boat sheets, it is hoped that the hydrographic party can be furnished boat sheets for their 1948 field work similar to those which were made for the Willamette River hydrography. (Photogrammetric Project Ph-13(46) and Hydrographic Project CS-323)

*See also  
1948  
1949*

Because of insufficient photograph coverage, small interior areas near the limits of the map manuscripts could not be detailed.

Whenever possible the stereoscope was used in determining the location of the tops of bluffs along the shoreline. The location of these bluffs could be determined more readily from photographs on which they were displaced away from the water line and principal point of the photograph. Detail pass points were radially plotted near or along the tops of these bluffs so that they could be compiled as accurately as possible.

In many places it was very difficult to identify sufficient pass points for the compilation of roads. This was particularly true in areas of severe changes in relief, and in places where roads wound through dense woods. Similar conditions caused trouble in compiling the drainage, especially since the use of the stereoscope was very limited in interior areas.

Because of the numerous new roads and many changes in road alignment, it was found easier to compile all through roads as they appeared on the photographs rather than to make comparisons with old surveys and quadrangles, and to compile only the changes as suggested in the instructions for this project.

It is believed that all provisions of Paragraph 32 of the Instructions relative to drafting have been applied to the map manuscripts.

#### 29. Supplemental Data:

The following maps, which are being forwarded with the map manuscripts, were used to supplement the photographs:

Black and White Prints--6 each--Bureau of Reclamation Index Maps  
Nos. 10 to 15 Inc. ✓

The following map, which was also used, will be forwarded when the project is completed:

Black and White Print--Existing and Relocated Highways and Railroads,  
Scale 1"=4 miles. ✓

#### 30. Mean High-Water Line: (Lake Shoreline at the adopted plane of reference)

A complete discussion of this feature may be found in Paragraph 7 of the "Field Inspection Report Area of the First Radial Plot" which was forwarded on 13 February 1948.

The mean high-water line (Lake shoreline at the adopted plane of reference) is shown by a continuous, black acid ink line, .008" in thickness, at a plane 1290.0 ft. above Mean Sea Level. There are no marsh areas bordering the shoreline.

*A profile of the reservoir water level, from Grand Coulee Dam to the International Boundary, is attached to the Descriptive Report for the Fifth Radial Plot (T-8863 to T-8865).*

31. Low-Water and Shoal Lines:

The field inspection unit did not indicate any low-water lines within the limits of these map manuscripts.

Approximate shoal lines have been shown by a light, dashed, black acid ink line, as indicated by the field party.

32. Details Offshore from the Mean High-Water Line:

A small rocky island is the only detail offshore from the Mean High-Water Line. (Refer to Paragraph 10 of the Field Inspection Report) T-8862

33. Wharves and Shoreline Structures:

Refer to Paragraph 9 of the Field Inspection Report.

34. Landmarks and Aids to Navigation:

Form 567, recommending the following landmarks for charting, is attached:

HOUSE (Chimney)-----T-8860 ✓  
BARN (Southwest Gable)-----T-8861 ✓  
SPIRE (Church)-----T-8861 ✓  
    Triangulation Station M.E. CHURCH SPIRE (USBR)  
BARN (West Gable)-----T-8862 ✓  
HOUSE (West Peak)-----T-8862 ✓

Form 567, recommending the charting of the following non-floating aids to navigation is attached:

Nine Mile 23 Light-----T-8860 ✓  
Lower Wilmont Daybeacon 26-----T-8860 ✓  
Wilmont 28 Light-----T-8861 ✓  
\*Gerome 30 Light-----T-8861 ✓  
Falls Creek 31 Light-----T-8861 ✓  
Harvey Creek 32 Light-----T-8862 ✓  
Severn Springs 33 Light-----T-8862 ✓  
Bissell Flats 34 Light-----T-8862 ✓

35. Hydrographic Control:

Statistics on signals in the area of these three map manuscripts are as follows:

<u>Sheet No.</u>	<u>Signals Pricked by Field Parties</u>	<u>Signals Rejected</u>	<u>Photo Hydro Signals Established</u>
8860	57	5	52
8861	86	7	79
8862	56	1	55

\* Description in Pacific Coast Light List, 1947 states that this light is on the west side of the lake. It is, in fact, on the east side & is so described on fm 524. Nautical Charts was notified of this discrepancy.

In most cases, the signals selected by the field party could be identified on a majority of the photographs of the area involved. Most of the signals, which were rejected, were located in dense tree areas, or hidden by displaced cliffs or ridges, and could not be identified with certainty on enough photographs to establish strong positions. (The field party could not determine this point with alternate photographs.) Due to previous difficulties, exceptional care has been taken in pricking and radially plotting the photo hydro signals shown on these three map manuscripts. Their locations were not only verified by the reviewer and the supervisor in charge of compilation, but a final examination of this part of the work also was made by the Chief of Party, who rejected any signal on which a perfect intersection could not be obtained. These multiple checks should eliminate the difficulties which the hydrographic party encountered in the first sheets in this project.

A list of the photo hydro signals, shown on these three map manuscripts, is attached to this descriptive report.

36. Landing Fields and Aeronautical Aids:

Form 567 is attached recommending the charting of the triangulation station "MILLER LOOKOUT TOWER (USER), 1936," as an aeronautical aid. There are no landing fields in the area.

37. Geographic Names: 814 ✓

Geographic Names are the subject of a special report, "Investigation of Geographic Names, Sheets 8860 to 8872 Inclusive, Project Ph-2(45)", which has been submitted to the Washington Office by the field party.

During the compilation of T-8860, it was found that a geographic name had been omitted from the above geographic name report. It is:

"Mitchell Point"---In undisputed local usage. A landmark promitory which lies on the north side of the Franklin D. Roosevelt Lake about two miles northeast of Nine Mile Creek.

*one word - see  
names list attached.*

38. Recoverable Topographic Stations:

Copies of Form 524 are being submitted for all stations listed under Item 34, "Landmarks and Aids to Navigation" except SPIRE (Church) which is the triangulation station M.E CHURCH SPIRE (USER). No other recoverable topographic stations were selected by the field party, or radially plotted at the compilation office.

39. Junctions:

Complete and satisfactory junctions have been made between all map manuscripts in this and adjacent radial plots.

40. F. D. Roosevelt Lake Reservation Line:

Please refer to Item 40 in the Descriptive Report for the 1st Radial Plot, Project Ph-2(45).

44. Comparisons with Existing Topographic Surveys:

All existing maps of the area were at a much smaller scale, and were made before the waters of the F. D. Roosevelt Lake were impounded. Due to these facts, only a visual comparison could be made.

45. Comparisons with Nautical Charts:

There are no nautical charts of the area.

Respectfully submitted,

*J. Edward Deal Jr.*

DIVISION OF PHOTOGRAMMETRY  
Review Report of  
Shoreline Map Manuscripts T-8860 to T-8862  
(Area of the Fourth Radial Plot, Ph-2,45)

Subject numbers not used in this review report have been adequately covered in other parts of the descriptive report.

26. CONTROL

All second-order triangulation stations had been adjusted from Grand Coulee Dam Grid values to Lambert Projection values (N.A. 1927 Datum); and all third-order stations (the CP series) had been adjusted from the same grid to the Washington North Zone plane coordinate values.

A list of the recovered and unrecovered stations appearing on the map manuscript is attached to the descriptive report.

The following stations were added to the map manuscripts during review:

<u>T-8860</u>		<u>T-8861</u>		<u>T-8862</u>	
Stoner	USBR 1935	Glasgow	USBR 1934	Cedonia	USBR 1935
Smoke	" "	Gold, I.S. (SS)	" 1935	Landslide	" 1936
*Larsen	" "	Dredge	" "	Covada	" "
Fog, I.S.	" "	Elbow SS	" "	Moore	" "
		Nez Perce SS	" "	Putnam	" "
		Cole, I.S.	" "	Fobes, I.S.	" "
				Butte, SS	" "
				Bissell, I.S.	" "

\*LARSEN, on page 1043 of the G.P. list, is spelled LARSON on the U.S.C.S. map covering Net No. 3 of Second-Order Triangulation, Columbia River. ~~The U.S.C.S. spelling was retained.~~

47. GEOGRAPHIC NAMES

A separate list (compiled by the Geographic Names Section) for each map manuscript is attached to this compound descriptive report.

43. COMPARISON WITH PREVIOUS TOPOGRAPHIC SURVEYS

There are no earlier topographic surveys, and the hydrographic survey is in process.

44. COMPARISON WITH EXISTING TOPOGRAPHIC QUADRANGLES

U.S.F. Bissell 1/125000 1939 (tactical). Not available for comparison.

*see H-7589 for slight shoreline change affecting T-8861. Only 7-1 x 50*

The adjoining maps of this series contain no contours; the highways and other culture are obsolete. It is, therefore, assumed that the present surveys supersede the survey listed above, for their common area except for the land net and boundaries, as was the case in the areas common to the other maps of the U.S.E. series.
