Photogrammetric Plot Report
Job PH-6903
Bahia de Guayanilla, Puerto Rico

October 1969

21. Purpose

The purpose of this pilot project is to test the feasibility of furnishing hydrographic surveys by photogrammetric methods. An area in Puerto Rico, Bahia de Guayanilla, was selected for the test.

22. Method

Seven (7) strips of 1:15,000 color photographs were bridged by analytical aerotriangulation methods, using a forty (40) photograph block adjustment.

23. Control

Eight (8) horizontal and twenty-four (24) vertical control stations were weighted in the final block adjustment. Seven horizontal stations were targeted and one was a natural object.

Two types of vertical control points were used:

1. Underwater points near floating targets and fixed hydro targets, depths of which were field determined, and
2. Shoreline points using infrared photography taken at low water and transferred to the color bridging photography.

The elevations of all underwater points were reduced from tide staff readings to the datum required (low water). The refined coordinates for these underwater points were corrected for refraction.

Shoreline point 42201 has an error of +3 feet. Upon closer examination it was found that the point was drilled on the side of a bush and evidently thus measured. Point 42201 should be discarded.

-2-

24. Photography

The definition and quality of photography taken with the RC-8 "L" camera were good, except for occasional sun spots which made measuring underwater points difficult.

25. Accuracy

The RMS for the block is 10.3 micrometers, with an RMS vertical error of 0.16 meters. Horizontal errors were not foreseen as a problem and as they are insignificantly small are not plotable at map scale, require no special mention.

26. Conclusions and Recommendations

The use of infrared photography flown in tandem with color for the purpose of furnishing vertical control at the water line introduced some inaccuracies. No difficulty was encountered transferring shoreline points from the infrared to the color when flown in tandem, but transferring the point to adjoining color strips proved very difficult because of wave action.

In future jobs of this kind, it might prove worthwhile to use targets to determine elevations of vertical control points needed. A target could be placed near the shore and a hand level shot from the water's edge to target, with date and time recorded, would determine the elevation.

In order to get depths in water areas where vertical control is needed, concrete blocks painted white could be placed in the water. In all probability a target could be seen underwater to a depth of ten feet or more.

Respectively submitted,

I. I. Saperstein

Approved and forwarded,

Henry P. Eichert
Chief, Aerotriangulation
Section

Compilation Report
TP-00174 through TP-00177

These four surveys are to be compared with the latest hydrographic surveys of the area. The purpose for this special project is to analyze the possibilities for providing hydrographic surveys by photogrammetric methods.

31. Delineation

The Wild B-8 stereoscopic instrument was used to compile the four surveys.

32. Control

Refer to the Photogrammetric Plot Report bound with this report.

The identification, density and placement of horizontal and vertical control was adequate.

33. Supplemental Data

Inapplicable.

34. Contours (Underwater) and Drainage

All drainage on these four manuscripts is from office interpretation of the photographs.

The quality of the photographs and diapositives covering the following four surveys of this project was good except as noted in the following paragraphs.

TP-00174

The 6', 12' and 18' underwater contours (depth curves) and underwater spot elevations (soundings), were compiled in the areas not affected by a suspended silt and pollution condition of the water. The poor water conditions rendered it impossible to compile depth curves in the lagoon area west of Punta Verraco and the north shore extending from the lagoon to the eastern limits of this survey. If the water conditions had been favorable, this survey could have been compiled with a minimum of effort.

-2-

TP-00175

The 3', 6', 9' and 12' underwater contours and underwater spot elevations were compiled in the areas not affected by the suspended silt referred to in survey TP-00174.

An attempt was made to overcome the silting conditions by setting additional stereomodels in various ways. A stereomodel was cleared, leveled and horizontalized using color transparencies 69-E(C)-9960, dated April 30, 1969, time 0810 and 69-E(C)-174, dated May 3, 1969, time 1635. A few additional underwater spot elevations were obtained in this solution, but were considered weak.

Another stereomodel, using photography from two separate flights, 69-E(C)-175 and 69-E(C)-195, was set with negative results. Stereomodel 69-E(C)-195 and 69-E(C)-197, eliminating photo 69-E(C)-196, was also set, but it too was unproductive.

As in TP-00174, this survey could have been more completely compiled but for the poor condition of the water.

TP-00176

The 6', 12' and 18' underwater contours, underwater spot elevations, sunken rocks with spot elevations and rocks awash were compiled. In stereomodel 69-E(C)-182 and 69-E(C)-183, some difficulty was encountered compiling contours in an area where the bottom characteristics were grass and sticky mud. The grass and mud area appeared as a very soft part of an otherwise solid stereomodel.

Sunglare in stereomodels 69-E(C)-183 through 185 and the pollution in model 69-E(C)-221 and 69-E(C)-222 at latitude 17°58'15" and longitude 66°47'30", made it impossible to complete the 6' and 12' underwater curves in this small area.

TP-00177

The 3', 6', 9', 12' and 15' underwater contours, underwater spot elevations, sunken rocks with spot elevations and rocks awash were compiled. The stereomodels set in this survey were soft below the 9' underwater curve, limiting the number of readable underwater spot elevations.

An additional model, 69-E(C)-9788 and 69-E(C)-9789 (1:10,000 scale transparencies) was set to supplement the underwater compilation, but no additional information was obtained.

-3-

The 6' and 9' underwater curves in the area of latitude 17°58'30" and longitude 66°45'30" are considered to be very weak.

Note:

Refraction corrections were applied to all of the underwater curves and underwater spot elevation compiled on the four manuscripts of this special project.

35. Shoreline and Alongshore Details

There was no shoreline inspection. The shoreline was delineated from office interpretation of the photographs. The mean low-water line was not delineated.

36. Offshore Details

Refer to Item 34 of this Compilation Report.

37. Landmarks and Aids

All landmarks and aids were located by office interpretation of the photographs.

No Form 567 submitted.

38. Control for Future Surveys

No Form 524 submitted.

39. Junctions

These four surveys have been joined together and the junctions are in agreement. As this is a special project, no attempt was made to make a junction with any other contemporary survey in the area.

-4-

40. Horizontal and Vertical Accuracy

No comment.

41. Conclusions and Recommendations

Refer to Item 26 of the Photogrammetric Plot Report bound with this report.

Underwater compilation was impeded in many areas throughout this project due to the polluted conditions of the water. Suspended silt in the water was evident in most of the stereomodels, limiting the penetration capabilities of the photography.

In future jobs involving water penetration, it would prove valuable to visually survey the area to be mapped, before aerial photography is recommended.

42. through 45. Not applicable.

46. Comparison with Existing Maps

No comparison made.

47. Comparison with Nautical Charts

Comparison has been made with Chart No. 928, scale 1:10,000, 6th Edition, December 16, 1968.

Items to be applied to Nautical Charts immediately:
Copies of these four surveys should be forwarded to the Marine Chart Division for comparison with the most recent hydrographic surveys in the area.

Items to be carried forward: None
