SUMMARY

Project PH-7017, Afognak and Kodiak Islands, Alaska, consists of 33 maps. Seven, TP-00284 through TP-00290, are at 1:10,000 scale and 26, TP-00291 through TP-00316, are at 1:20,000 scale. The project area is the northwestern coast line of Kodiak and Afognak Islands and their interface with Shelikof Strait. The project extends from Big Bay in the northeast to Cape Ugat in the southwest. The photogrammetric survey depicts the shoreline and other cartographic features of mapping interest in the coastal areas and navigable waterways bisecting the islands.

The purpose of the project was to provide shoreline data for maintenance of the Nautical Charting Program and in support of hydrographic survey operations planned for the area.

Field operations consisted of recovery, establishment, and identification (premarking) of horizontal control necessary for aerotriangulation. No field inspection was conducted for this project. Panchromatic photographs required for aerotriangulation of the entire project area and subsequent compilation of the 1:20,000-scale maps were obtained with the RC-9 "M" camera at 1:60,000 scale. Supplemental color photographs at 1:20,000 scale were acquired for those areas to be mapped at 1:20,000 scale using the RC-8 "E" camera. Areas to be mapped at 1:10,000 scale were covered by 1:30,000-scale color compilation photographs also obtained with the RC-8 "E" camera. The 1:30,000-scale compilation photographs were controlled by aerotriangulated points derived from the 1:60,000-scale panchromatic photographs. All calculations pertaining to the vertical relationship of the photographs to the datums, mean lower low water and mean high water, were derived from predicted tidal information.

A field edit was performed by personnel of the Pacific Marine Center's hydrographic survey vessels, while conducting hydrographic survey operations in selected areas. These field edits, occurring over four field seasons, were limited to the boundaries of the hydrographic surveys, thereby creating numerous partially field edited maps. Field edits occurred during the 1972, 1973, 1977, and 1981 field seasons.

27

The aerotriangulation of the project was divided into two phases (Part I and II), in order to expedite the delivery of photogrammetric map data in support of hydrographic survey operations. Eighteen strips of photographs were bridged using analytic aerotriangulation methods. Horizontal control used was field identified (premarked). Vertical control was taken from U. S. Geological Survey quadrangles. Aerotriangulated control proved adequate and meets the requirements of the National Standards of Map Accuracy.

Compilation was performed in the Coastal Mapping Section, Atlantic Marine Center, Norfolk, Virginia. Delineation was accomplished using a Wild B-8 stereoplotter through application of standard shoreline mapping techniques. This was supplemented by graphic compilation techniques in selected areas. Delineation was based on an office interpretation of the 1:60,000 scale panchromatic, and 1:20,000- and 1:30,000-scale natural color, photographs. All line work on the base maps was smooth drafted. In areas where the stage of tide for individual photographs, based on predictions, was determined to be within the required 1 foot of the vertical datum mean lower low water, the approximate datum was delineated on the map using graphic compilation techniques.

Final review was performed in the Coastal Mapping Unit, Rockville Maryland, office. The base maps and associated data of this project meet the requirements of the National Standards of Map Accuracy. The base maps and reports comply with the project instructions.

The Descriptive Reports prepared for each map contain all the information pertaining to the completion of each map.

FIELD INSPECTION

TP-00295

Field inspection was limited to the recovery and
identification of horizontal control for aerotriangulation.

PHOTOGRAMMETRIC PLOT REPORT
Afognak Island, Alaska Part I
Job PH-707117
March 1972

21. Area Covered

This report pertains to 13 sheets on Afognak Island. The sheets are TP-00284 thru TP-00290 at 1:10,000 scale and TP-00291 thru TP-00296 at 1:20,000 scale. The area covered is the northwest shoreline of Afognak Island.

22. Method

Eight strips of photography were bridged by analytic aerotriangulation methods and adjusted to ground on the Alaska state plane coordinate system, zone 5. Strips 1 and 2 of 1:60,000 scale photography were adjusted as a block and used to control the six strips of 1:30,000 scale photography.

23. Adequacy of Control

The horizontal control is sparse in both strips of 1:60,000 scale photography. However the project should still meet the map accuracy standards.

24. Supplemental Data

Vertical control was taken from USGS topographic quadrangles.

25. Photography

The photography was adequate.

COMPILATION REPORT

TP-00295

31. DELINEATION:

Delineation was by the Wild B-8 stereoplotter, for all details except the mean lower low water line of Malina Bay which was compiled graphically from the 1:20,000 scale color photography covering that area.

32. CONTROL:

See Photogrammetric Plot Report, dated March 1972.

33. SUPPLEMENTAL DATA:

None.

34. CONTOURS AND DRAINAGE:

Contours are inapplicable. Drainage was delineated from office interpretation of the photographs.

35. SHORELINE AND ALONGSHORE DETAILS:

The mean high water line and alongshore details were delineated from office interpretation of the photographs. A mean lower low water line was shown in Malina Bay. No photography suitable for this purpose was flown over Paramanof Bay.

36. OFFSHORE DETAILS:

Several offshore rocks and islands were compiled in the office without benefit of prior field inspection. The positions and configuration of these features is considered to be good however.

37. LANDMARKS AND AIDS:

None.

38. CONTROL FOR FUTURE SURVEYS:

None.

39. JUNCTIONS:

See Form 76-36b, item #5, of the Descriptive Report.

40. HORIZONTAL AND VERTICAL ACCURACY:

No statement.

46. COMPARISON WITH EXISTING MAPS:

A comparison has been made with the following USGS quadrangles: Afognak (A-3) and Afognak (B-3), ALASKA, scale 1:63,360 and dated 1954.

47. COMPARISON WITH NAUTICAL CHARTS:

A comparison has been made with the following National Ocean Survey charts: 8534, scale 1:78,900, 5th edition, dated January 30, 1971 and 8556, scale 1:350,000, 4th edition, dated November 20, 1971.

ITEMS TO BE APPLIED TO NAUTICAL CHARTS IMMEDIATELY:

None.

ITEMS TO BE CARRIED FORWARD:

None.

FIELD EDIT REPORT

OPR-478-73

NOAA SHIP RAINIER

CDR. K.W. JEFFERS,
Commanding

INTRODUCTION METHODS

Field edit was accomplished by personnel of the NOAA SHIP RAINIER, between 15 May and 19 August 1973. Work was done in a sixteen foot skiff, making landings where it was necessary to verify shoreline character.

Field edit work was begun in the area north of Black Cape, on Afognak Island, at the mouth of Devil Inlet, and extended southwestward to the landward end of the main part of Malina Bay. The shoreline from Cape Paramanof to Cape Tanaak was not inspected. See the reference sketch of field editing completed for precise delineation of work accomplished. Field editing was completed on manuscripts TP-00291, TP-00292, and TP-00296. Field editing was begun but not finished on manuscripts TP-00294 and TP-00295. No field edit was done on manuscript TP-00293.

All additions and corrections are noted in purple on the field edit discrepancy sheets and in red on the field edit film ozalids. Deletions are noted or accented in green. Photographs used in this field edit were from PH-7017. Values for distances to the mean high water line and rock heights were estimated. All time observations are referenced to 135° West longitude.

Following the text is an appendix comprised of:

- 1) Sketch of field edited shoreline
- 2) List of detached positions
- 3) Complete listing of photo-hydro signal tape
- 4) Copies of triangulation recovery notes for stations used for photo-hydro control

ADEQUACY OF COMPILATION

The compilation of the mean high water line was generally good. Compilation of offshore and foreshore features was often incomplete: several rocks readily identifiable on the photographs were omitted. Time and height data for these items are have been included on the photographs.

DISCUSSTION AND RECOMMENDATIONS

TP-00286 (completed) No special recommendations are required.

TP-00291 (completed) No special recommendations are required.

TP-00292 (completed) No special recommendations are required.

TP-00293, No field edit was done on this sheet.

TP-00294 (not completed) The shoreline of Paramanof Bay on this sheet was field edited as far west as Cape Paramanof. No field edit was done from Cape Paramanof to Tanaak Cape. The shoreline from Tanaak Cape eastward to $153^{\circ} 00'00''$ W longitude was field edited, as well as the southern shore of Malina Bay between $153^{\circ} 01'00''$ and $153^{\circ} 02'00''$ W longitude. The rest of the

shoreline of Malina Bay was not inspected. No special recommendations are required.

TP-00295 (not completed) Only the shoreline of Paramanof Bay was field edited, None of the Malina Bay shoreline was field edited. No special recommendations are required.

TP-00296 (completed) No special recommendations are required.

respectfully submitted,

M.H. ALLEN

51 METHODS

Field edit of TP-00295 involved two areas. The first was a small portion on Ban Island and was edited on foot (see color-photo 6141). The second was the contiguous bays, Malina and Malka. These bays were edited, for the most part, by small boat (see photo #224, #225 and color photos 6730, 6734, 6736, 6738, 6739). Photo control was provided in Malina and Malka Bays. Communications between the hydrographer and field editor were excellent. To avoid oversights and misidentification, each rock that was transferred to the rough boatsheet from various sources was assigned a letter designator A-Z or AA-ZZ. Heights or depths of rocks were noted on the photographs along with GMT (local +9 hours). A thorough description of deletions, additions and corrections is included in section 53 Map Accuracy, accompanied by diagrams transferred from the 1:10,000 scale rough boatsheet.

Depending upon weather conditions and tide states, the field editor planned daily operations in the following order:

- 1) Picking and field marking of photo signals, concurrent with shoreline annotations on matte photos 225 and 224.
- 2) Transfer and pricking of photo signals on respective photographs.
- 3) Building of signals.
- 4) Annotating Boatsheet RA-10-1-77 as to dangers to navigation.
- 5) Complete rock investigation prior to and concurrent with hydrography, keeping a field edit notebook and transferring all information to the photographs upon arrival to the ship in the evening.
- 6) Updating the GP's of various photo signals.
- 7) Returning to rocks not located at minus tide states.

Extremely low tides were experienced during daylight hours which enabled the field editor to return to areas involving rock deletions to double and in many cases triple check on these deletions.

52 ADEQUACY OF COMPILATION

The compilation of manuscript TP-00295 is complete and adequate except as noted in section 53. Compilation of MHWL was very good with the exception of one small area in the vicinity of signal #391. The MLLWL

was compiled by hydrographic survey operations and is not addressed in this report. For further information on this subject refer to Descriptive Report H-9684.

53 MAP ACCURACY

All rocks added to the T-sheet are in red, those verified are in purple, and those to be deleted are in green.

The following pages include a table of explanations and six figures describing any and all changes to the rocks or shoreline features in the area common with TP-00295 and Hydrographic Survey H-9684. Figures 1-6 address not only the rocks on the T-sheet, but also show a comparison with rocks on prior survey H-2973 1908 1:20,000 scale and the rocks on chart 16604 1976 1:78,000 scale. A color coding at the bottom of each figure differentiates rocks as to their source and what action should be taken on them. The repositioned or new rocks are annotated in red and have been transferred directly from the photograph to the T-sheet. Deletions of rocks in Figures 1-6 are written in green and the remaining verified rocks include colors corresponding to the survey, chart, or T-sheet they were transferred from (i.e., purple for survey H-2973, brown for chart 16604, blue for TP-00295). Rocks deleted from the prior survey or chart are not annotated on TP-00295.

Table I is a master list of the rocks, their source and the action taken on them, if any. Following the figures and Table I is a narrative description of certain rocks which needed greater explanation than could be accomplished by figures or tables.

"A" (Transferred from C-16604, not found) see Fig 1

A thorough search for Rock "A" was carried out but it was not found. The area searched is defined in Fig 1 by a dotted line 0125Z June 29, 1977 (JD 180). A Boston Whaler ran a pattern north and south with the

two rocks depicted on the photographs are not separate but part of a single rock mass and ledge which extends northwest from the rock mass. The table below lists time, position and leadline soundings obtained by the hydrographer at a +1.2 fathom tide stage.

<u>Day/Time Group</u>	<u>Geographic Position</u>	<u>Leadline Sounding</u>
182320	58° 10' 48"525 N 152° 55' 17"876 W	0.1 Fathoms
182407	58° 10' 48"797 N 152° 55' 17"015 W	0.2 Fathoms

"J" (Transferred from chart 16604 1:78,000; repositioned)

A search pattern for a rock in the vicinity of "J" was carried out in a half-circle of a 100 meter radius using signal 362 as the center. The search was conducted in a Boston Whaler using 10 meter spacing with 10 ft. water visibility and no rock was found in "J"'s location. However, a RK 7' 1705Z June 28, 1977 (JD 179) was found and is annotated on color photograph #6736 inshore of the transferred Rock "J". It is recommended that the 1908 position be updated to reflect the position of the RK 7' 1705Z June 28, 1977 (JD 179) mentioned above.

"R" (New subm rock) see Fig 4

Rock "R" annotated RK SUBM 2' 1545Z June 29, 1977 (JD 180) was seen by hydrographers while running a line in the area and designated a letter. It is identified on photo 6738 as a submerged rock and is annotated on TP-00295. It is recommended that this submerged rock be added to the chart.

"S" (Transferred from H-2973) see Fig 4

Rock "S" was searched for in an area from signal #329 west to #336 and from the shoreline 150 meters north at 1600Z June 29, 1977 (JD 180) (approx -2 tide state) and no rocks were found in this area by the field editor. A line of hydrography was run over the area of rocks and it was not found at that time. The search was done in a Boston Whaler with an approximate 10 meter spacing with visual inspection in 15' visibility water. It is recommended that this rock be deleted from the chart.

In search for Rock "S" two rocks close to shore were found and are annotated on the color photo #6738 as RK SUBM 4' 1600Z June 29, 1977 and RK 4' 1600Z June 29, 1977. The depths on the submerged rocks were determined with a leadline.

"X" (Transferred from TP-00295)

Rock "X" appears to be 2 rocks, RK 2' 2235Z May 27, 1977 (JD 147) and Rock 3' 2335Z annotated on color photo 6730. Since the rocks are separated by approximately 20 meters, even though they are connected by a submerged rock ledge, it is recommended that two rock symbols be used.

"AA" (Transferred from TP-00295) see Fig 4

Rock "AA" is marked on the chart with a single rock symbol when it is actually 3 rocks in a cluster with 40 meter spacing between the centers of the rocks. From the north working south, they are annotated RK 2' 0155Z May 30, 1977 (JD 150), RK 1' 0155Z May 30, 1977 (JD 150) and RK 3' 0155Z May 30, 1977 (JD 150). It is recommended that the two most seaward rocks be symbolized in this area (refer to color photo 6730 and Fig 4).

"II" (Transferred from chart 16604 1:78,000 scale) see Fig 5

After scanning this particular foul area a number of times and also after looking at the color chronopaque photos it is obvious that RK "II" is merely the same RK as "HH" (a rock transferred from the T-sheet). It has simply lost accurate positioning in the scale change from the 1:78,000 scale chart to the 1:20,000 boatsheet. It is obvious that rock "HH" is the correct position of the rock. The correction should be reflected on the next chart edition.

"JJ" (Foroe Rock, new) see Fig 4

Rock "JJ" annotated in red as RK SUBM3' 0150Z (JD 149) on photo 6730 and visible on photo 6738 was originally found by and was named after the coxswain of our aluminum launch RA-5. The rock was struck by the keel of the launch during investigatory field edit work. Up to and including this time only black and white photos were taken to the field. These photographs do not show any of the real dangers to navigation and it was felt necessary by the field editor to carry the color photos from this point on and to annotate them upon arrival to the ship. The color photos were a tremendous help in providing complete field edit notes and for the safe passage of the launch over submerged rocks.

"NN", "OO", "PP" (see Fig 6)

RK "NN"	LAT 58° 10' 47" N
	LON 152° 59' 30" W

RK "OO"	LAT 58° 10' 42" N
	LON 152° 59' 30" W

RK "PP"	LAT 58° 10' 35" N
	LON 152° 59' 32" W

All three rocks, "NN" "OO" and "PP" were transferred to the rough boat-sheet from chart 16604, 1976 ed. A thorough search was conducted for all three of these rocks at 0115Z June 28, 1977 (JD 179) and again at 1730Z June 29, 1977 (JD 180) (approx +0 tide state) and there were no rocks found in any of the three locations. The search was conducted in a Boston Whaler at low tides in an area 100 meters north of the river mouth that lies east of "NN". A search pattern of 10 meter spacing was run 100 meters offshore heading south approximately 100 meters south of signal #313, with line spacing decreasing to 5 meters in the vicinity of the rocks. The bottom contour was relatively flat and visibility was 15-20 ft. Green deletion notes are annotated on both black and white photo #225 and on TP-00295. Color photo 6738 covers this area at an approximate +0.9 tide state and there are no visible rocks or submerged rocks noted. It is recommended that the rocks "NN", "OO", and "PP" be removed from the chart.

"XX" (New rock) see Fig 4

Rock "XX" was found by the field editor at a negative tide state and is annotated on color photo 6738 as baring 5' at 1615Z June 29, 1977 (JD 180). It is seaward of the MHWL approximately 20 meters and would be a danger to navigation. It is recommended that it be added to the chart.

"YY" (New rock) see Fig 4

Rock "YY" which is annotated on color photo 6738 as baring 1' 1605Z June 29, 1977 (JD 180) was observed at an extremely low tide. Although the rock is fairly small, it is located approximately 10-20 meters north-west of a small island and may prove to be a danger to navigation for small boats approaching the island. It is recommended that this rock be added to the chart.

"ZZ" (New rock) see Fig 1

RK "ZZ" is annotated on photo #6734 baring 1' 0000Z May 29, 1977 (JD 149). It would clearly be a danger to navigation for a small boat if the boat were to land on the island south of the rock from the main part of the bay. It is recommended that this rock be included on the chart.

An islet on TP-00295 with geographic position $58^{\circ} 11' 00''$ N, $152^{\circ} 54' 39''$ W is visible on photo #6736 in a river mouth. It appeared to be a small sand bar deposit. This area was checked at both high and low tides and no such islet was found. After inspection of the area it is obvious that such a deposit has shifted since the photographs were taken in 1971, and no longer exists. It is recommended that it be removed from the chart.

54 RECOMMENDATIONS

Due to the superior nature of the color chronopaque photos in terms of clarity and tide coverage, it is recommended that color photos always be

made available for field editors. I cannot stress the important part these photos played in navigation through hazardous areas and in photo locating signals. Although the PMC OORDER section addressing field edit operations states, "Chronopaque photos are not to be taken into the field," it was felt by the field editor that a complete and accurate job of field edit could not have been accomplished without these photos in the field. Their compact nature allowed them to be protected by plastic bottom sample bags.

55 MISCELLANEOUS (Photo Identified Signals)

Field edit operations for JOB PH-7071¹⁷ TP-00295, scale 1:20,000 included the identifying and locating of 38 visual signals for hydrographic survey operations RA-10-1-77, H-9684, OPR-478-RA-77. Twenty-seven of these signals were identified and located photogrammetrically while the remaining eleven are hydro signals. The photo located signals have been rayed in on the Master Field Edit and photo signal Ozalid. The number adjacent to the signal corresponds with the number on the Master Station List.

The Hydro signals were located by three independent means. 1) Subpoint Method, 2) Resection by horizontal direction observations from a signal to many others using a Wild T-2 theodolite, or 3) Resection by horizontal angle observations from a signal to many others using a sextant.

Programs RK-407 and RK 300 were used to compute geographic positions for the subpointed signals.

During the beginning stages of the survey, jumps were found in the position of the soundings when signals used by the survey launch were changed while running a particular survey line. Signals 345, 346, 349 and 362 were occupied by a Wild T-2 theodolite and cuts were taken to all visible signals. More accurate geographic positions were computed for 345, 346, 349, and 362 by the method of resection. Consistent computations of the geographic positions for each of these signals were natural checks for Signals 318, 390, and 391 were occupied and sextant resection was used to update their positions.

Computer Program RK 300 was used to compute the geographic positions of the signals located by the T-2 or sextant. All field computations for each photo signal and hydro signal are included in the Photo Signal Computations Section of the "Separates Following the Text" of Descriptive Report H-9684.

REVIEW REPORT
TP-00295

61. General Statement

Refer to the summary bound with this Descriptive Report for an overview of the photogrammetric operations related to the production of this map and associated data.

62. Comparison with Registered Topographic Surveys

Comparison with registered topographic surveys was not a requirement for this project.

63. Comparison with Maps of Other Agencies

Refer to item 46 of the Compilation Report bound with this Descriptive Report for detailed information on this topic.

64. Comparison with Hydrographic Surveys

Comparison with hydrographic surveys was not a requirement for this project.

65. Comparison with Nautical Charts

Refer to item 47 of the Compilation Report bound with this Descriptive Report for information on this topic.

66. Adequacy of Results and Future Surveys

This map meets the National Standards of Map Accuracy and the requirements specified in the project instructions.

67. Mean Lower Low Water Line

An approximate mean lower low water line was delineated within the confines of Malina Bay as it appears on this manuscript. The symbolized line was delineated through an office interpretation and application by graphic compilation techniques of the 1:20,000-scale "E" camera, color photography listed on NOAA Form 76-36 B, item #1, Compilation Photography. The stage of

tide indicated for the photographs was based on predicted tides. The mean lower low water line depicted should be considered approximate and advisory only. For more information on the datum, mean lower low water, refer to the contemporary hydrographic survey of the area.

68. Delineation

Map detail was compiled on the Wild B-8 stereoplotter using the 1:60,000-scale "M" camera, panchromatic photography. This was supplemented by office interpretation and graphic compilation techniques of the 1:20,000-scale "E" camera, color photography, both of which are listed on NOAA Form 76-36 B, Compilation Photography.

- * - 1 Film Ozalid, TP-00303
- * - 1 Film Ozalid, TP-00310
- * - 1 Film Ozalid, TP-00311

- 2 of 3: - Binder of Aerotriangulation Printouts
- Binder Descriptive Report Control Records
C&GS Form 164
- Binder of Photographic Flight Report
ESSA Form 76-15
- Binder of Control Station Identification
Cards, C&GS Form 152
* - Binder of Computed Tide Curve Graphs &
Stage of Tide Computations for Photographic
and Field Edit Data
* - Binder of Pacific Marine Center generated
Computer Addendum to Horizontal Control
Reports
* - Binder Tide Data and Zoning Information
- Bridging Photographs and Film Positives

- 3 of 3:* - 1 Sounding Volume for TP-00303
* - 1 Sounding Volume for TP-00310
* - 1 Sounding Volume for TP-00311

PHOTOGRAPHS 9X9 FORMAT

- * - NOS 3 Aug. 71 E (C) 7352 thru 7355

RECORD OF APPLICATION TO CHARTS

FILE WITH DESCRIPTIVE REPORT OF SURVEY NO. TP-00295

INSTRUCTIONS

A basic hydrographic or topographic survey supersedes all information of like nature on the uncorrected chart.

1. Letter all information.

2. In "Remarks" column cross out words that do not apply.

3. Give reasons for deviations, if any, from recommendations made under "Comparison with Charts" in the Review.

CHART	DATE	CARTOGRAPHER	REMARKS
